Telecommunications

Cool air for 'hot lines'

Cooling cellular telephone stations and other telecommunications equipment is both a basic necessity and a complex task, particularly when it comes to providing maximum reliability.

Diagonal and centrifugal fans from ebm-papst pass this test with excellence!

Providing customer-specific designs and noise-optimized solutions comes naturally to us.

From the very start, we design and develop our products with the goal of giving our customers the greatest possible benefits of reliability and performance .

Thanks to the compact design of our fans, each type can be used in a way that saves space and is optimally suited to any device design.

Applications

Base station

So that we are always within reach

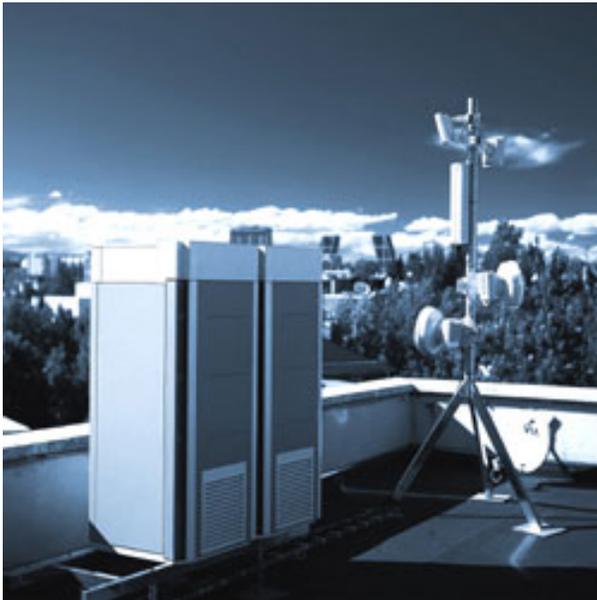

Base stations are an indispensable part of our mobile world. They ensure that we can communicate with each other while mobile, anywhere in the world. Fans from ebm-papst keep the base station electronics at a uniform low temperature and reliably guide away lost heat.

This minimizes the risk of failure of individual components and extends the service life of the system.

Telecommunications cooling units

Withstanding any kind of weather

Cooling units for control cabinets are used in environmental conditions defined by high temperatures and an oily and aggressive atmosphere. ebm-papst primarily offers centrifugal fans for this area, but also axial fans for internal and external circulation in cooling units.

Since fans in external circulation systems are directly exposed to the environment, they need to be weatherproof. To ensure optimum quality in this area, our fans are specifically tested for resistance to humidity, temperature fluctuations and salt spray fog.

They also feature load-dependent speed control as well as outstanding low-noise characteristics and long service life.
